

ABSTRACT OF THE DISCLOSURE

A body device has a dual mode function and includes: a play-back mode setting unit for selecting a plurality of play-back modes such as a CD mode, an AM mode, an FM mode and
5 so on; and a control unit for controlling the play-back mode setting unit so as to select an arbitrary one of the play-back modes in response to a predetermined operation on the front side or the rear side. When an operation to select and demand the FM mode on the rear side in a dual mode while the front
10 side is in the AM mode, the control unit inhibits the FM mode selection on the rear side so that the AM mode on the front side may not be changed into the FM mode.
